

SCOOP YOUR PET POOP, S.A.!

Walk your dog for exercise – pick up their poop for the environment!

Why Scoop?

- Pet poop left on the ground washes into our rivers and creeks when it rains, causing harmful bacteria like E.coli and salmonella to contaminate the water and make it unsafe for swimming or fishing.
- Pet poop can add excess nutrients like nitrogen to river and creek water, decreasing its oxygen level and killing native fish and plants.

It's the law! When you leave your pet's poop on the ground, you violate San Antonio City Ordinance Section 5-19, Leash and Pooper Scooper Required. Don't get fined!

How to Scoop

- Scoop and seal pet poop in a pet waste pickup bag - these are available at most retail and pet supply stores. Dispose of all pickup bags in the nearest trash can.
- Use a tool or bag device to scoop up the poop - NEVER pick it up with your bare hands. Always wash and clean your hands with soap immediately after disposing of pet poop.
- Scoop any pet poop found on you lawn each week. Always scoop it before a rainstorm so it isn't swept into a storm drain or drainage ditch.

Did you know?

- According to the FDA, the average-sized dog makes at least one half-pound of poop each day. That equals to one half-ton of poop made by one dog each year!
- Pet poop is NOT a good natural fertilizer for lawns or gardens because of the high amounts of E.coli and bacteria it contains.
