What is Asthma?
Asthma causes the airways to narrow, swell and produce extra mucus making breathing difficult. Both environmental and genetic factors are thought to contribute to the development of asthma. While there is no cure for asthma, it can be managed.  

Why Does it Matter?
Asthma costs 10 Americans their lives everyday, yet most deaths are preventable with proper treatment. Asthma also costs the U.S. $81.9 billion annually. In Bexar County, asthma cost residents almost $37.3 million in hospital fees in 2017. The occurrence and impact of asthma can be reduced by managing risk factors for asthma, educating those affected by the disease, and providing proper treatment.

In 2017, the prevalence of self-reported asthma among Bexar county adults surveyed was 10%. This is a 30.5% decrease since 2015 (Fig 1). In Texas overall, non-Hispanic Blacks report a higher prevalence of asthma than non-Hispanic Whites and Hispanics (Fig 2).

In 2017, the overall asthma hospitalization rate for Bexar County was 5.9 per 10,000 population. While this is a slight decrease since 2015, Bexar County’s rate is consistently higher than the rate for Texas overall (Fig 3). Non-Hispanic Blacks carry a higher burden of asthma in Bexar County: In 2017, the rate of asthma hospitalization was more than 2 times higher for non-Hispanic Blacks compared to Non-Hispanic Whites and Hispanics (Fig 4).
In Bexar County, male children experience asthma more than female children. For those under 10 years of age, the male asthma hospitalization rate is double the rate of females (Fig 7). This trend switches in adulthood, with the rate of asthma hospitalization in women more than double when compared to men (Fig 8).

Overall, the rate of Childhood Asthma Hospitalization was nearly 5 times that of Adults in 2017.

In Bexar County, male children experience asthma more than female children. For those under 10 years of age, the male asthma hospitalization rate is double the rate of females (Fig 7). This trend switches in adulthood, with the rate of asthma hospitalization in women more than double when compared to men (Fig 8).

Overall, the rate of Childhood Asthma Hospitalization was nearly 5 times that of Adults in 2017.
